### Removal, Inspection, and Re-Assembly

FIG. 237: Troubleshooting.

#### Removal

Remove the connector by loosening the glow plug nut installed on the cylinder head.

Remove the glow plug.

#### Inspection

Check for continuity across the sheath and center electrode. If there is no resistance, it indicates a short circuit, so replace the glow plug. If the resistance is infinite, it shows that pre-heating coil is burnt out, so replace the glow plug.

#### Re-Installation

Install the glow plug.

Install the nut on the glow plug and connect the connector.
