

**GR45** series has all AR400 1/2" outer tines and 3/8" inner tines. The GR45 is based on using the full power of a 45hp tractor. It can be used on higher hp machine for general use. These units have been time tested throughout the industry.

**GR60** series has all AR400 1/2" outer tines and 1/2" inner tines. The GR60 has all the same features just built even stronger yet. This unit has been time tested throughout the industry as well.

Both units have 2" x 6" cylinders, which are rated at 3000 psi. At 3000 psi the combined is 18,850 lbs of force.

The mounts on these units are low and tight against the main frame to retain the factory breakout force.

Like all of the Anbo product line the lower tines are smooth with no protrusions or jagged teeth, this lets the material slide up and not bunch up at the bottom and when dumping the material will not hang up on the rake. This prevents you from having to shake the grapple rake to dislodge smaller branches and roots
